

# Release Notes

NSS Labs' Cloud Platform for  
Continuous Security Validation

Version 3.8

---

## 1. Introduction

This document highlights new features, enhancements, and bug fixes for the Cloud Platform for Continuous Security Validation version 3.8. It also documents known limitations and workarounds.

## 2. Compatible Products

This release should be compatible with virtually any modern browser, and has been tested on the following browsers and operating systems:

- Google Chrome on:
  - Windows 10
  - OS X Mojave 10.14
- Apple Safari on:
  - OS X High Sierra 10.13

## 3. New Features and Enhancements

- Added email and HTTP delivered malware threats for relevant endpoint product categories. Email and HTTP delivered malware is not supported for network security product categories in this release.
- Malware testing results are now expressed in the UI as malware delivered via HTTP and email rather than as malware delivered via exploit.
- The Exploits tab on the Analyze page has been renamed to Tested Threats, which has sub-tabs to filter the view based on threat type, delivery mechanism, and test result.
  - Clicking on an NSS ID will bring open a page that lists individual test results for that threat.
  - Clicking on an individual test result NSS ID will bring up test details and a menu to download artifacts such as PCAP, SAZ, and payload.
- Removed the Security Products tab and replaced its contents by enhancing the Overview tab.

## 4. Bug Fixes

- Notification emails now contain the correct subdomain of caws.nsslabs.com.

## 5. Known Limitations

- There is an intermittent issue when downloading some malware artifacts from the UI (PCAP, SAZ, payload) causing a long delay in download and eventual timeout error. If it occurs, please re-attempt the download.
